

NMU-IR-260914 — Incident Investigation Report

Tests: entities, timelines, tables, uncertainty, exact numbers, evidence grounding, executive summary and advisory generation.

1. Executive Overview

At 09:12 UTC on 14 September 2026, the fictional Northbridge Municipal Utilities (NMU) security team detected anomalous outbound traffic from an engineering workstation. The investigation identified unauthorized access to the engineering network and exposure of 214 GB of operational documents. No evidence was found that physical control commands were altered.

2. Key Facts

Field	Value
Incident ID	NMU-IR-260914
Severity	High
Detection	14 Sep 2026, 09:12 UTC
Containment complete	14 Sep 2026, 17:40 UTC
Affected systems	11 engineering endpoints; 2 file servers
Data accessed	214 GB
Estimated service impact	37 minutes
Actor label	THREAT-GROUP-ORCHID (fictional)
Attribution confidence	Moderate

3. Timeline

Time (UTC)	Host	Event
09:12	NMU-ENG-07	Outbound traffic anomaly detected
09:26	NMU-ENG-07	Suspicious scheduled task identified
10:04	NMU-FS-02	Unauthorized archive creation observed
11:18	NMU-JMP-01	Credential reset initiated
13:05	NMU-ENG-07	Endpoint isolated from engineering VLAN
17:40	NMU-ENG-07	Containment validated

4. Indicators

Type	Value	Confidence	Source
IP	203.0.113.44	High	Firewall log
Hostname	NMU-ENG-07	High	EDR
Hash	SYNTH-8A71C2	High	Forensic image
Domain	orchid-lab.example	Low	DNS telemetry

Type	Value	Confidence	Source
User principal	svc-engineering-sync	Medium	Identity logs

5. Remediation

Immediate actions: endpoint isolation, credential rotation, firewall blocking, and forensic preservation. Recommended follow-up: privileged-access review, engineering-network segmentation, stronger MFA coverage, 180-day identity-telemetry retention, and a tabletop exercise within 60 days.

Analyst Note

Treat THREAT-GROUP-ORCHID as an investigation label, not a confirmed identity. This uncertainty must be preserved in every generated artifact.
