

CECA — Modernizing Emergency Communications

Tests: public-facing transformation, video package, infographic, social copy and planned-vs-completed distinction.

A More Resilient Communications Network

The fictional Coastal Emergency Communications Agency (CECA) is modernizing its emergency communications network to improve reliability during storms, infrastructure failures, and high-volume public alerts.

What Is Changing?

The program replaces aging relay equipment, adds geographically distributed backup capacity, improves monitoring, and introduces a unified alerting workflow. Delivery is planned in three phases between October 2026 and June 2027.

By the Numbers

Measure	Planned value
Relay sites upgraded	24
Backup communication hubs	6
Target alert delivery time	under 90 seconds
Program duration	9 months
Planned investment	\$4.8 million

Community Impact

During upgrades, individual sites may experience short maintenance windows. Emergency services will retain alternate communication paths throughout the work. Public alerts will continue through existing channels while the new system is introduced.

Transformation Challenge

Generate: a 90-second video script with scene descriptions, a public infographic content plan, a short social post, and an executive summary. Preserve the distinction between planned targets and completed results.
